RE:	Noise Impact Assessment Water and Wastewater Servicing Municipal Class Environmental Assessment Study Nobleton, Ontario	

Dear Rajan,

RWDI was retained by Black & Veatch (B&V) to assist in completing a qualitative assessment of the potential noise effects related to the water and wastewater servicing improvements in the community of Nobleton, Ontario. The need for the proposed improvements were identified in the 2016 York Region Water and Wastewater Master Plan and are subject to a Schedule C Municipal Class Environmental Assessment Study (EA). This memo was prepared in support of this EA and assesses the potential noise levels of the alternative design concepts (Water Supply Alternative A2, Water Storage Alternative B, and Wastewater Servicing Alternative A). RWDI has prepared a separate memo focusing on air quality levels (air and odour emissions).

Background

The service and EA study areas are shown in Figure 1. See Appendix A for figures of the locations of individual facilities.

Study Area and Service Area

Figure 1: Study Area and Service Area

This memo focuses on the proposed changes to Well #2, Well #5, Water Resource Recovery Facility (WRRF), and the Janet Avenue Pumping Station as these were the only alterations expected to have a potential change in noise. Their locations, property boundaries and alternative design solutions are shown at the end of this memo.

Design specifics are evolving to meet planning requirements. At this stage, the following upgrade design details are known:

- Well #2 - Upgrade throughput from 22.7 L/s to 32 L/s;
- Well #5 - Add one new production well (32 L/s) and potential upsize of existing standby generator;
- WRRF - potentially add new primary, secondary and tertiary treatment infrastructure, new effluent pump station;
- Janet Avenue Pumping Station - potential upsizing of pumps, wet well and existing standby generator, and a new flow attenuation tank.

In support of Technical Memo 3, RWDI prepared a high-level qualitative assessment of the potential effect of the proposed changes, dated April 30, 2021. Since the preparation of the qualitative assessment, RWDI conducted site visits of each of the locations noted above to observe the current operations, measure the sound levels of the existing equipment and the existing sound levels at the residences nearest to each site.

This assessment expands on the previous qualitative one, by quantifying the potential future noise levels based on the existing site operations and the potential upgrades, and by providing preliminary mitigation measures to address any potential non-compliance issues related to noise. To determine compliance and the potential for nuisance, RWDI is using Ontario Ministry of the Environment, Conservation and Parks (MECP) Environmental Noise Guideline – Stationary and Transportation Sources – Approval and Planning (NPC-300). The NPC-300 exclusion limits (i.e. sound level limits) for continuously operating stationary sources are summarized in **Table 1** below.

Table 1: NPC-300 Exclusion Limits – Continuous Stationary Sources (LAeq-1hr)

Time Period	Class 1 Area		Class 2 Area		Class 3 Area	
	Outdoor	Plane of Window	Outdoor	Plane of Window	Outdoor	Plane of Window
Daytime 0700-1900h	50 dBA	50 dBA	50 dBA	50 dBA	45 dBA	45 dBA
Evening 1900-2300h	50 dBA	50 dBA	45 dBA	50 dBA	40 dBA	40 dBA
Nighttime 2300-0700h	--	45 dBA	--	45 dBA	--	40 dBA

Different types of sources are also assessed separately. There are separate comparisons with the criteria for impulsive, continuous, or emergency type sources. The limits for testing of emergency sources such as emergency generators are 5 dB higher than comparable continuous sources.

The study area fits the Class 2 area definition where the acoustical environment is dominated by sounds of human activity and traffic during the daytime (07:00 - 19:00) and defined by the environmental and infrequent human activity at night (19:00 - 07:00). Because of the operational nature of the equipment, the most stringent exclusion limit of 45 dBA was used for this assessment. Emergency sources were evaluated against a 5 dB higher limit.

Other upgrades will also be made as part of the community improvements and include upsizing of the forcemain along King Road and to Janet Avenue station, upsizing concrete outfall to the WRRF, and increase of overall well supply. These upgrades are simply to manage flow and are not expected to result in changes in the operational noise levels once completed. Noise from construction activities is not the subject of this memo.

Site Visit

RWDI conducted site visits of the four sites on June 16, 2021. Site visits were coordinated with York Region staff to ensure equipment can be turned on/off at each location in order to measure equipment sound levels and the sound levels at the nearest residences under normal and equipment testing scenarios. York Region staff accompanied RWDI at all times and provided detailed information on the operating schedules of each equipment and the typical operating scenarios at each site. These measurements were completed in order to establish a baseline from which changes to the sound levels can be assessed.

All sound level measurements were conducted during calm, sunny weather, using a Brüel and Kjær Type 1 sound level meter in accordance with MECP NPC-103 "Procedures" document.

Potential Noise Impacts

The proposed upgrades are not substantial but could result in minor changes of the overall sound levels at each of the four locations. These changes can be easily managed through appropriate building design and/or at-source acoustical mitigation. RWDI has provided a brief, quantitative assessment of the existing conditions and proposed changes for each of the four locations, as well as practical, conceptual mitigation that can be implemented during the detailed design stage to minimize the sound level changes due to the upgrades.

Well #2

There are two main types of noise sources at Well #2 – the pumps and the scrubber. According to York Region staff, the pumps are always on while the scrubber is used only in emergency situations when a leak is detected. However, the scrubber is tested monthly.

Under normal operating conditions, i.e. without the scrubber, sound levels of up to 57 dBA were measured just outside of the exhaust louvers. This equates to a sound level of approximately 40 dBA at the façade of the nearest residences which is in compliance with NPC-300, and a sound level of 51 dBA in the backyards which is above the NPC-300 criteria for outdoor amenity spaces as noted in **Table 1** above. With the throughput increased, this sound level may increase but it is expected to remain in compliance.

During scrubber testing, sound levels of up to 81 dBA were measured along the eastern property line, directly in line with the scrubber exhaust. The estimated sound level at the residence nearest the scrubber exhaust is approximately 63 dBA which is above the NPC-300 criteria for emergency sources. Scrubber noise can also be heard through the main roll-up door and exhaust louvers and those sound levels were measured to be up to 69 dBA along the other property lines. Levels of approximately 51 dBA are expected at other residences (at the plane of window) that do not have direct line-of-sight. If the scrubber is tested during the nighttime hours, the levels could be above the NPC-300 criteria but

only marginally. This is not a significant exceedance and can be easily mitigated with readily available measures such as an exhaust silencer and acoustical louvers. If scrubber testing is conducted during daytime hours, the sound levels at the residences is in compliance with NPC-300.

Normal operating scenario sound levels appear to be in compliance with the NPC-300 standards at the facades of the existing residences but are marginally above the standards for outdoor amenity spaces. The emergency testing scenario, which entails the operation of a scrubber is already above the NPC-300 criteria. The proposed changes are expected to marginally increase the sound levels; thus, sound levels should be addressed. Potential mitigation measures could include:

- Acoustical roll-up door;
- Acoustical louvers;
- Scrubber exhaust stack silencer.

Well #5

Well #5 is similar to Well#2 with the exception of an emergency generator which is also tested on a monthly basis along with the scrubber.

Under normal operating conditions, sound levels immediately outside of Well #5 were measured to be up to 63 dBA. This results in sound levels of approximately 39 dBA at the facades (i.e. plane of window) of the nearby residences and levels 57 dBA in the outdoor amenity spaces. The levels at the amenity spaces are marginally above the applicable limits summarized in **Table 1**.

Generator and scrubber testing sound levels were measured to be up to 90 dBA near the exhaust louvers and exhaust stacks. Observations were also made along the northeast property line, in-line with the façade of the nearest residence to the east. Generator and scrubber sound levels were not audible over the sound of traffic along Highway 27, but they are estimated to be above the applicable criteria in the outdoor amenity spaces summarized in **Table 1**.

The proposed upgrades are expected to increase the sound levels. But based on our observations, any increases can be readily mitigated through the use of a scrubber exhaust silencer and an appropriately designed acoustical enclosure, and exhaust silencer, for the outdoor generator.

Although the new generator is expected to be in an acoustical enclosure, it should also be designed in such a manner to meet the noise exemption criteria for outdoor units outlined in Ontario Regulation 524/98 (O.Reg. 524/98). The following O.Reg. 524/98 sections apply to noise:

4. (1) 7 – *If a generation unit that is part of the system is located outdoors, the sound pressure level resulting from the discharge of sound from the unit and related exhaust stacks must not be greater than 75 decibels (A-weighted) at a distance of seven metres from the unit.*

4. (2) For the purposes of paragraph 7 of subsection (1), a generation unit is deemed to be located outdoors if the only structure within which the unit is located is a structure whose sole purpose is to soundproof the unit or to protect it from the elements or to do both.

There are other O.Reg. 524/98 criteria related to air quality that are provided in the odour and air quality memo.

Nobleton Water Resource Recovery Facility

An acoustical model was prepared for the existing WRRF operations. Modelling of sound level propagation to the receptors was completed using Cadna/A, a commercially available implementation of the ISO 9613 algorithms. Input data was comprised of both measured and manufacturer data for equipment that was down for maintenance or could not be operated during the site visit. Sound levels at the nearest residence to the northwest was estimated to be 46 dBA, which is above the applicable nighttime limit of 45 dBA outlined in **Table 1**. If comparable to existing sources, the proposed improvements are expected to increase the levels to a total of 49 dBA, which is above the NPC-300 criteria. Potential mitigation measures can include:

- Locating rooftop equipment, such as exhaust fans and HVACs at the southern portion of the property, or behind structures to take advantage of barrier effects;
- Conduct sludge operations indoors;
- Use low noise motors/blowers or enclosures if operating outdoors;
- Use low noise rooftop exhaust fans and locate them as far south as possible;
- Use of acoustical louvers for openings facing the farmhouse.

Changes to the WRRF will require an Environmental Compliance Approval (Air and Noise). In support of this approval, MECP will require WRRF show compliance with the NPC-300 under an operating scenario that would result in the highest theoretical sound level at the nearest residence. To ensure the worst-case operating scenario is in compliance, RWI recommends the acoustic model be updated during the detail design phase and prior to purchasing any equipment or finalizing building design and location. The updates should include new building layout, equipment location and capacities, operating schedules, trucking routes, and any other relevant changes that may affect sound levels once the details of the upgrades are better known.

Cadna/A modelling outputs are provided in **Appendix B** at the end of this memo.

Janet Avenue Pumping Station

The generator at the Janet Avenue Pumping Station is the most dominant source of noise. On-site measurements were conducted at the pumping station louvers and along the property lines of the nearest residences to the south and east. Property line measurements at the residences were as high as 55 dBA and are just in compliance with the NPC-300 daytime criteria for emergency sources of 55 dBA.

If the generator is upsized, it should be designed to meet the O.Reg. 524/98 exemption requirements to minimize the nuisance potential to neighbouring residences. At present, it is not known whether a new generator would be accommodated within a building structure (preferred for noise reduction) or outside as a packaged unit (preferred for exemption through O.Reg. 524/98). Either option should be appropriately mitigated and designed to limit noise levels at the nearby residences. Mitigation can include:

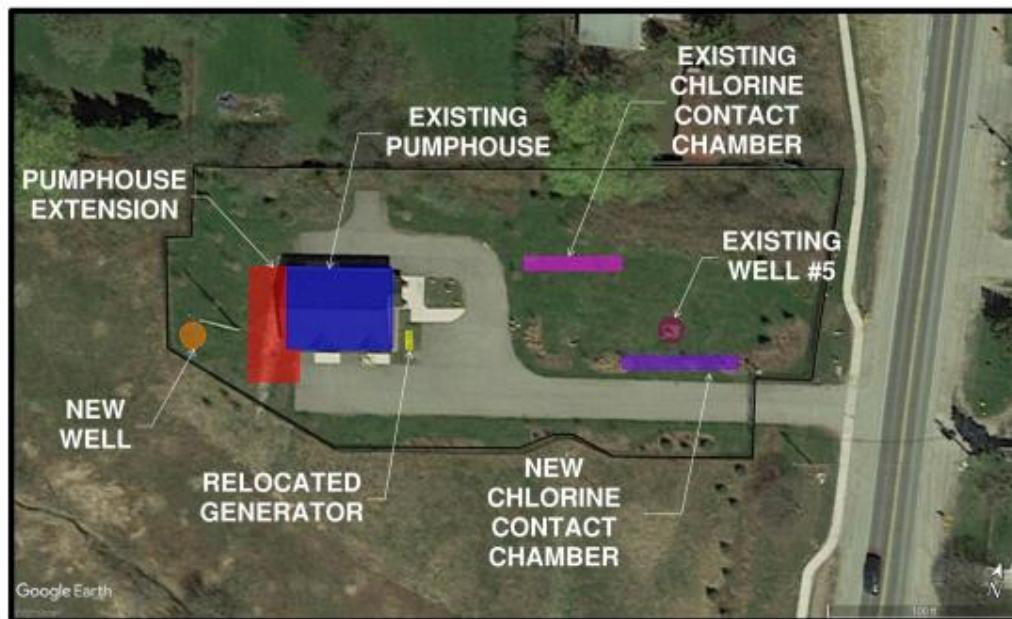

- Acoustical enclosure, inclusive of appropriate intake and exhaust silencers, if unit is located outdoors;
- Acoustical louvers on ventilation openings and exhaust stack silencer if unit is located indoors (assumed masonry façade building).

Conclusion

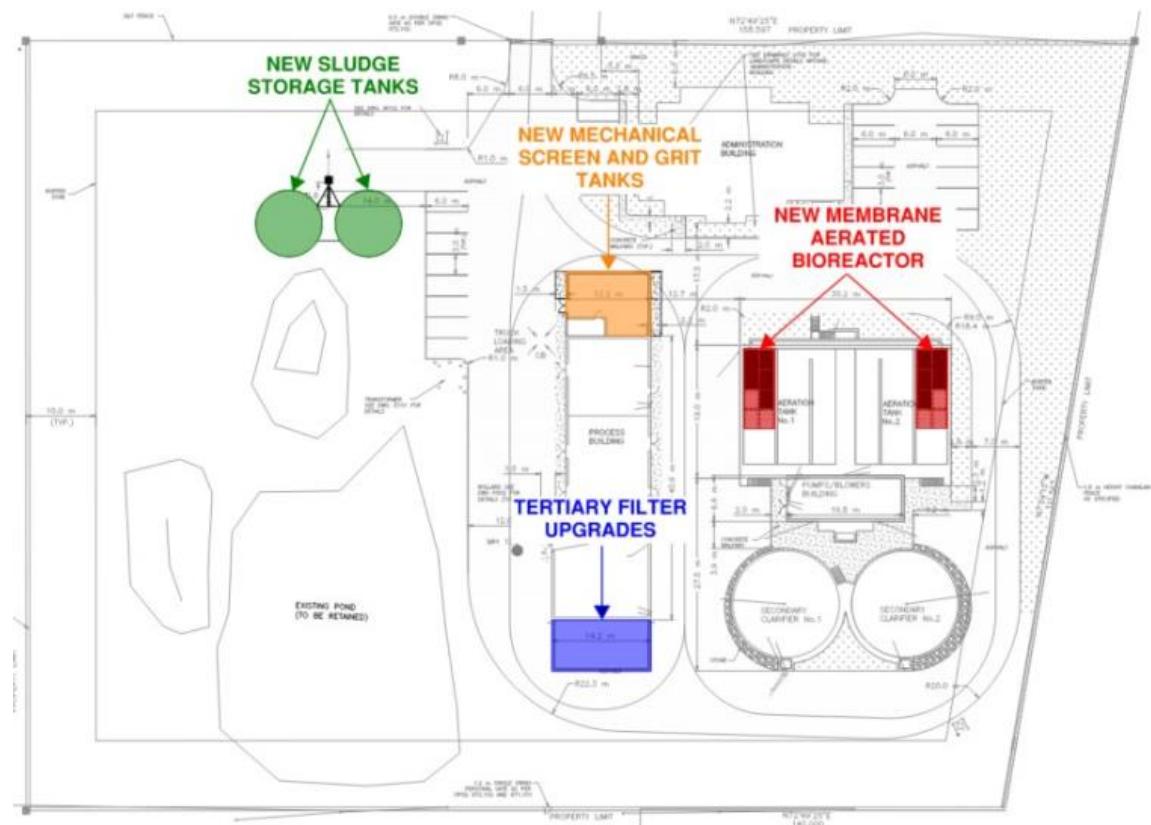

The proposed improvements are typical of those necessary to meet the demand of a growing community. Measurements of existing operations indicate that there are already some minor exceedances at existing residences. None of the improvements appear to be major and although there may be minor increases of the operational sound levels, they can be managed through simple mitigation measures. Given the marginal non-compliance, the mitigation measures are not expected to have an impact on operations or be particularly costly.

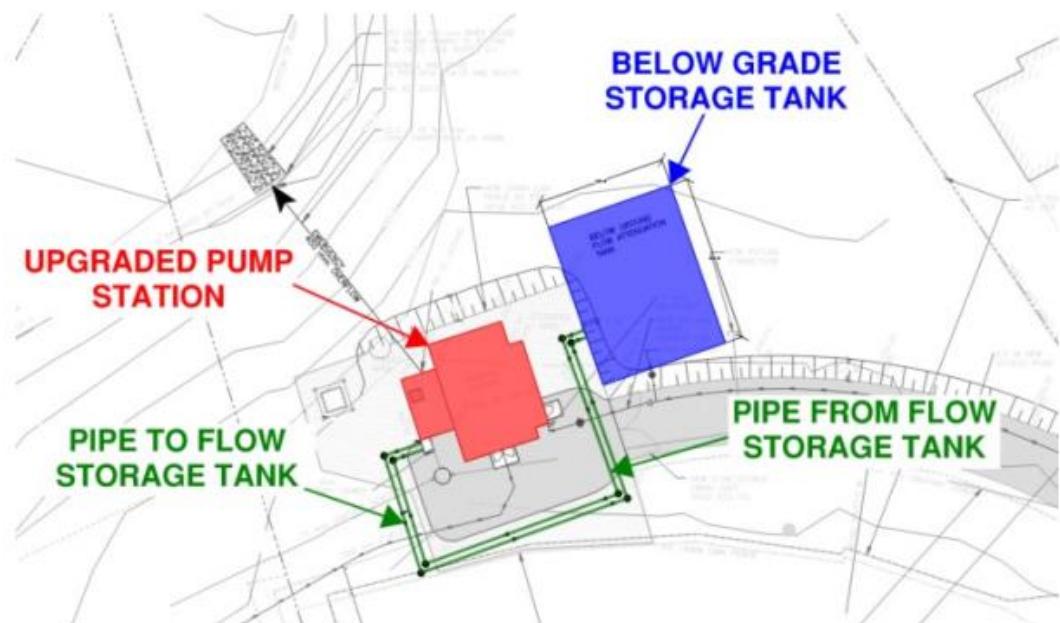

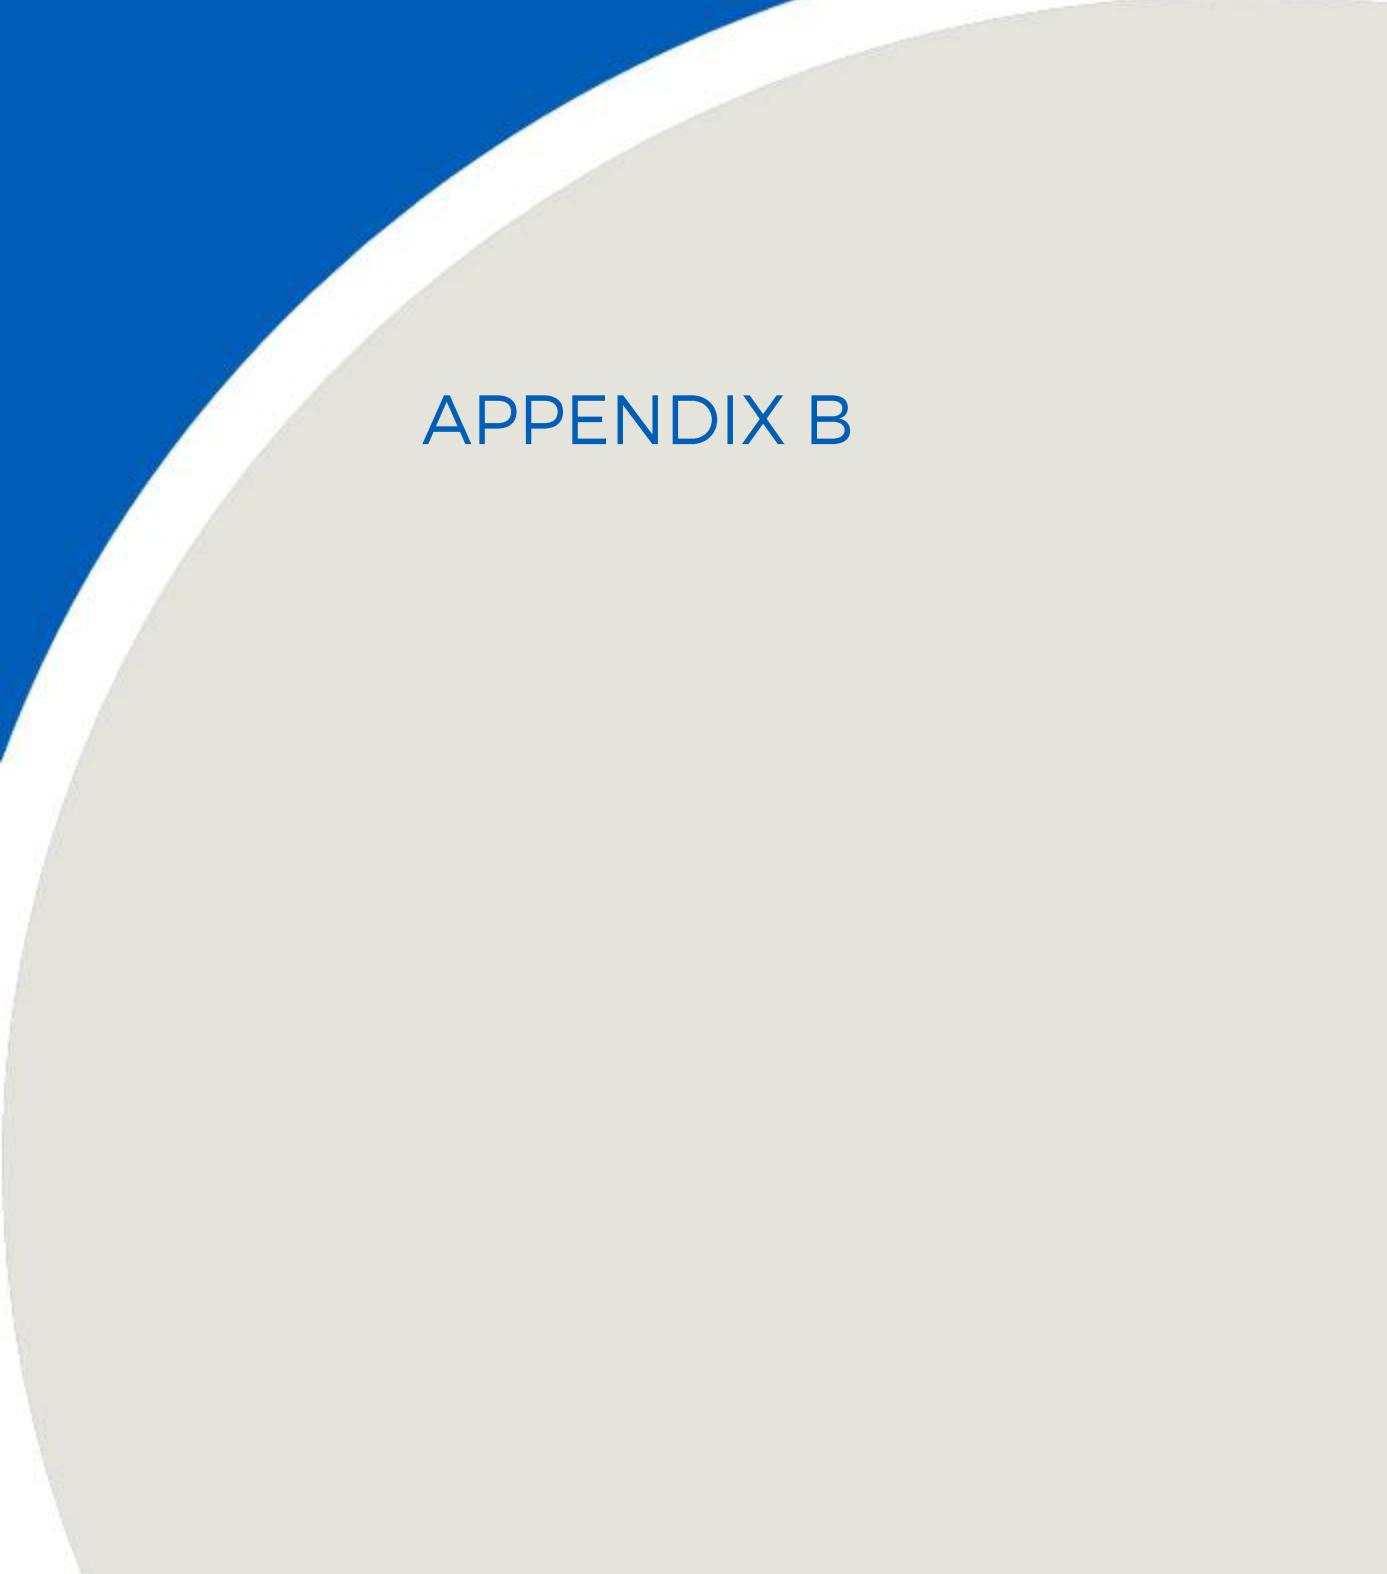

APPENDIX A

Source Water Protection Evaluation

Project Description

In order to accommodate Nobleton's growth to the 2041 horizon the following upgrades will be needed in the wastewater system:

1. Janet Avenue Sewage Pump Station Upgrades (66 Janet Ave)
 - a. Replace existing pumps to increase capacity from 107 L/s to 145 L/s
 - b. Build new below grade storage tank
2. Nobleton Water Resource Recovery Facility (7277 King Rd)
 - a. Addition of membrane aerated bioreactors to existing aeration tanks
 - b. Addition of two sludge storage tanks
 - c. Expansion of process building
 - d. Replacement of mechanical screens and grit tanks
 - e. Upgrade of tertiary filters
 - f. Upgrade UV disinfection system

All of the proposed upgrades and/or expansions will occur within the already existing sites.

Water Source Protection

The Clean Water Act, 2006 (CWA) consists of several regulations and policies to protect water sources before they enter the municipal drinking water system. As part of the CWA, the Source Protection Plan (SPP) includes a set of policies to protect human health, ensure adequate safe clean water is available and protect current and future water sources from significant threats. As part of the plan, vulnerable areas are delineated around surface water intakes and wellheads for every existing and planned municipal residential drinking system.

The SPP identifies different types of vulnerable areas, the ones relevant to this project include:

1. Wellhead Protection Areas (WHPA): areas on the land around a municipal well; the area size is determined by how quick water travels underground to the well.
2. Significant Groundwater Recharge Areas (SGRA): areas characterized by porous soils that allow water to seep easily into the ground and flow to an aquifer.
3. High Vulnerable Aquifer (HVA): area with an aquifer that is susceptible to contamination because of its location near the ground's surface or where type of materials in the ground are highly permeable.
4. Wellhead Protection Area-Q (Water Quantity): areas where a significant or moderate stress on drinking water quantity has been identified; in these areas, activities that take water without returning it to the source might become a significant threat.

Using the [Source Protection Information Atlas](#) the following Source Protection details were obtained for the locations where the wastewater upgrades will be taking place:

1. Janet Avenue Pump Station Upgrades (66 Janet Ave)

Source Protection Details for Location

Source Protection Area: Toronto
Wellhead Protection Area: **B**; score is **6**
Wellhead Protection Area E (GUDI): **No**
Intake Protection Zone: **No**
Issue Contributing Area: **No**
Significant Groundwater Recharge Area: **No**
Highly Vulnerable Aquifer: **Yes**; score is **6**
Event Based Area: **No**
Wellhead Protection Area Q1: **Yes**; Stress: **Moderate**
Wellhead Protection Area Q2: **Yes**; Stress: **Moderate**
Intake Protection Zone Q: **No**

Significant Drinking Water Threats at this location:
Threats list by zone can be found at this [link](#).

Information is current as of: June 16, 2021

2. Nobleton Water Resource Recovery Facility (WRRF) (7277 King Rd)

Source Protection Details for Location

Source Protection Area: Toronto
Wellhead Protection Area: **No**
Wellhead Protection Area E (GUDI): **No**
Intake Protection Zone: **No**
Issue Contributing Area: **No**
Significant Groundwater Recharge Area: **Yes**; score is **4**
Highly Vulnerable Aquifer: **No**
Event Based Area: **No**
Wellhead Protection Area Q1: **Yes**; Stress: **Moderate**
Wellhead Protection Area Q2: **Yes**; Stress: **Moderate**
Intake Protection Zone Q: **No**

Information is current as of: June 16, 2021

As per Regulation 287/07, under the CWA there are 21 threats for which policies are written in areas where these threats could be significant. Out of these 21 threats, the one that applies to this project is “2. the establishment, operation or maintenance of a system that collects, stores, transmits, treats or disposes of sewage.” The Tables of Drinking Water Threats (2017-2018) established by MECP were used to determine the chemical and pathogen threats in each area based on type of vulnerable area. Since the parcel of Nobleton WRRF is not classified as WHPA, IPA or HVA no chemical or pathogen threats were identified in the Tables of Drinking Water. For the Janet Avenue Pump Station, the threats that applied to a WHPA-B and HVA with a Score of 6, did not meet the flow rates, included chemicals not used in the Pump Station, included septic systems, or did not apply to the work that is being done in this project. Therefore, no chemical or pathogen threats were identified for this location.
